25X1

1. It is estimated that when the Komló coal mine will be in full production the maximum output will be 720 carloads per day of approximately 17 tons per each carload.
2. As of December 1953, the output at Komló was an estimated 200 carloads per day. The mine had considerable difficulties of even keeping to this figure, because of rolling stock shortages.
3. When in full production the Iron Works at Sztálinváros, which Komló is designed to feed, will require a daily supply of 940 carloads. The difference will therefore have to be imported, presumably from Poland.
4. Experts forecast that at the production rate of 720 carloads per day the coal deposits in Komló would last only about fifty years.
